## Film Splicer

### INSTRUCTIONS for USE

1. Lift top jaw assembly to upright position - place roll of Neutape in splicer.
2. Using sprocket pins at right hand end of splicer bed, position film for straight splice so that frame line is centered over lower cutting blade (on diagonal model, place film accordingly). Trim right and then left hand film and position in splicer bed on center pins only, using red mark to locate ends of film butted together.

If dirt or oil is on the film in splice area, wipe with clean cloth to insure maximum tape adhesion.

3. Pull tape from supply roll across film lining up the tape with edge marks on front guide bracket. Press tape onto film to eliminate any air bubbles.
4. Lower top jaw assembly and press hand lever to full downward position. (This will trim tape at both edges of the film and perforate sprocket holes in tape). Lift top jaw assembly and again press tape to film across entire splice area.
5. Remove film from splicer, flip over to repeat Steps 3 and 4. This will produce a smooth, stable splice with tape on both sides of the film.

NOTE: On Model 16-SW (Wrap Around), after Step 2, position trimmed film emulsion up and apply tape as in Step 3. Trim and punch as in Step 4. Lift film from splicer, fold over perforated tab extension, wrapping tape around other side of film.

### MAINTENANCE SUGGESTIONS

1. To take full advantage of maximum trim blade life, remove accumulated tape "trimmings" from front tape guide. If using other than Neutape, there may be an adhesive build up on front and back blades - this should be removed as well as any residue on front and back tape guides.
2. When replacing trim blades, DO NOT adjust blade holder. Trim blade must not touch lower matrix - there should be no metal to metal contact.
